Name of Experiment: Full Wave Rectification (using bridge rectifier) Theory: Rectification is a process by which alternating voltage is converted into a direct voltage. Semiconducting diode performs this work effectively. There are two types of rectifiers, viz.- half wave rectifier and full wave rectifier.

EXPERIMENT 3: THYRISTOR RECTIFIERS . 1. Objective. The objective of this experiment is to study the control and operation of the single-phase full thyristor-bridge. The control and gate drive circuit of the bridge is examined. The waveforms of the bridge are studied under resistive load and under continuous conduction.

EXPERIMENT 3: THYRISTOR RECTIFIERS

Full wave rectifier finds uses in the construction of constant dc voltage power supplies, especially in general power supplies. A bridge rectifier with an efficient filter is ideal for any type of general power supply applications like charging a battery, powering a dc device (like a motor, led etc) etc.

Figure shows the circuit diagram of three phase bridge controlled rectifier. It consist of upper group (T1,T3,T5) and lower group (T2,T4,T5) of thyristors .Thyristor T1 is forward biased ad can be triggered for conduction only when V_a is greater than both V_b and V_c . From figure this condition occurs at $\omega t=300$.

11. Define Ripple factor 'r' and its values for the three types of rectifiers. Ans:Ripple factor can be defined as the variation of the amplitude of DC (Direct current) due to improper filtering of AC power supply. it can be measured by $RF = v_{rms} / v_{dc}$. Ripple factor for Half wave recifier is 1.21, FWR is 0.482 and Bridge recifier is 0.482

(2) Full Wave Rectifier (Bridge) A full-wave bridge rectifying circuit consists of four diodes connected in a diagonal manner that is nothing but in bridge topology. The functioning is very much similar like a center-tapped transformer. Even in this, both the positive side and the negative side of the cycles are utilized for rectification.

Full Wave Rectifier : Types, Working, and Its Applications

A drawing of a full-wave bridge rectifier is given below. The bridge is composed of four diodes in a diamond shape. During the positive half-cycle of input voltage v_{in} the terminal 'A' is at positive potential with respect to the terminal 'B' and because if this diodes D1 and D2 are forward biased whereas diodes D3 and D4 are reverse biased.
