Plus an electric motor is capable of turning a greater range of props to an IC engine, relative to how many volts are used, (number of cells). Choose the size of prop you want to use that will give you the performance you want, (not necessarily the same one as was on the IC engine), then look for a suitable electric power system that will turn it at the sort of rpm you want.

This is the type of model engineering you will see in this section. Building a running internal combustion engine in a small scale is one of the tougher projects you can take on in model engineering. As engines get smaller, tolerances must be tighter, and some things like the size of air and fuel molecules and electricity just don't scale.

**Model Engines—Internal Combustion Engines**  
- Very bulky compared to the dimensions of most small IC model engines. For model engines with outlines of half a shoe box it is hardly or not acceptable to build-in such a big high tension coil... - Rather large battery needed for the 6 or 12 volt supply with 3 to 5 Amps; most of the time not suitable to build-in.
