Deep neural networks have also been proposed to make sense of the human genome. Alipanahi et al. [1] trained a convolutional neural network to map the DNA sequence to protein binding sites. In a second step, they asked what are the nucleotides of that sequence that are the most relevant for explaining the presence of these binding sites.

The first practical photography introduced in 1839, used the process called daguerreotypes, and spirits were never captured. According to Owen Davies in "The Haunted: A Social History of Ghosts", ghost photography started with photographic experimentation using people standing in front of and behind glass windows or noting that the long exposures required at the time would often result in ...

To test the methods on different topologies, the application is split into two parts. The first part considers the full MT 103 network, providing an illustration of the reconstruction of large, sparse financial networks. The second part is concerned with reconstructing a subset of the full network, representing a dense medium-sized network.
