During the past 50 years, many researchers have investigated the behavior of steel guyed towers. Rowe (1958) developed a theoretical model in which guy cables were simulated as bars and new amplification charts were introduced for both stress and displacements in steel guyed towers.

The accuracy of results of structural analysis of any structure, including guyed towers, depends on how the loads on structure are assessed. The loads on the guyed tower include: wind loads, self weight and initial tension from guy cables. Since guyed towers are tall structures, the wind
