The greatest challenge in imaging thyroid cancer is distinguishing thyroid cancer from benign disease in the thyroid gland. Although thyroid cancer represents the most common endocrine malignancy in adults [1] , it is still rare compared with benign thyroid nodules, which are seen on high-resolution ultrasound in more than 30% of men and 50% of women over 50 years [2] .

Multimodal imaging of thyroid cancer : Current Opinion in ...

The thyroid gland cannot distinguish between stable (regular) iodine and radioactive iodine and will absorb whatever it can. In babies and children, the thyroid gland is one of the most radiation-sensitive parts of the body. Most nuclear accidents release radioactive iodine into the atmosphere, which can be absorbed into the body.
