Time Series Analysis and Forecasting is the process of understanding and exploring Time Series data to predict or forecast values for any given time interval. This forms the basis for many real-world applications such as Sales Forecasting, Stock-Market prediction, Weather forecasting and many more.

An Introductory Guide To Time-Series Forecasting

The stationarity of a time series data means that the statistical properties like mean, variance, and autocorrelation of the series do not change over time. The notion of stationarity of a series is important for applying statistical forecasting models since: most of the statistical methods like ARIMA are based on the assumption that the process is stationary or approximately stationary [1].

Time series - Wikipedia

The most important change in edition 2 of the book is that we have restricted our focus to time series forecasting. That is, we no longer consider the problem of cross-sectional prediction. Instead, all forecasting in this book concerns prediction of data at future times using observations collected in the past.

What Is Time Series Forecasting?

Time-series analysis was thus used to firstly describe and quantify the dynamics (trend and seasonality) of CPE episodes from August 2010 to December 2016. The second objective was to identify a methodological process using time-series modelling to forecast the evolution of CPE episodes for the 2017-20 period.

Forecasting is a method that is used extensively in time series analysis to predict a response variable, such as monthly profits, stock performance, or unemployment figures, for a specified period of time. Forecasts are based on patterns in existing data. For example, a warehouse manager can model how much product to order for the next 3 months based on the previous 12 months of orders.
